

SmartSPM 1000 - Performance Examples

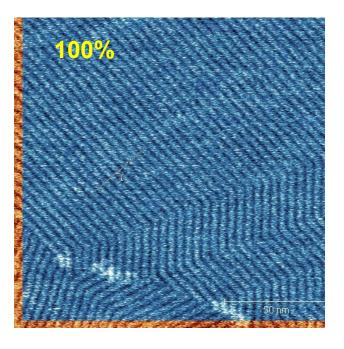

XY Closed Loop Performance at Sub-micron Scale

Two consecutive 150×150 nm topography scans of Cetyl Palmitate molecules on HOPG taken in 2.5 minutes one after another. The second image has been overlaid on the first, the transparency of the second image changing from 0% to 100%. Excellent performance of the XY closed loop system even at sub-micron scale can be derived from the perfect match between these two images after correction for the thermal drift ($\sim 2 \text{nm/minute}$).
